

Software Engineer

Description

Medusa is a commerce platform with a built-in framework for customization. We built Medusa after learning that all commerce companies always need some level of customization  even if they try to avoid it. Existing solutions force you to do hacky workarounds. We are offering a better way. Medusa has become the most popular open-source commerce project in under three years. Ahead of us is an enormous opportunity to build the platform that will power all digital commerce applications  existing and new. We are looking for great minds prepared to go the distance to build a once-in-a-generation company. About Medusa Medusa had its first commit in 2020, raised the first round of capital in 2021, and became the largest open-source commerce project on GitHub in 2022. Today, Medusa counts a 10k developer community, has crossed +1M npm downloads, and has raised \$9M in funding. Yet, we are only just getting started. For the past few years, the team has been fully focused on developing an open-source platform with modules for core commerce logic such as carts, customers, products, and order management. In combination with our framework for customization, we allow commerce companies of all sizes to build scalable and robust applications with custom business logic living natively in their stack. Our tools have been adopted by thousands of developers at companies ranging from the world's largest enterprises to fast-growing startups across +40 countries. The next big product leap is a cloud platform, bringing an unprecedented developer experience and native customization capabilities to commerce companies on hosted infrastructure. Building Medusa Cloud All commerce companies need some level of customization. Our open-source product and modular architecture provide the foundation to support this. We have proven this. However, companies using Medusa currently need to manage their own infrastructure. This is a burden and requires dedicated resources to build and maintain. We want to develop a cloud platform that sits on top of our open-source product, providing them with managed scalable infrastructure without compromising their customization capabilities. Working directly with our founding team, you will help shape how we structure some of the core parts of this new product domain and own implementation of these parts end-to-end. Examples of what you could work on A platform application with business logic related to accounts, projects, and environments A workflow engine to orchestrate actions spanning multiple – possibly distributed – services A bundler to create highly optimized bundles for serverless environments A search engine to read, filter, and sort data living in distributed data stores A product module that includes all business logic related to product information Who you are You enjoy solving highly complex problems You have extensive backend engineering experience You want to accomplish the seemingly impossible You like to work hard You despise a bad developer experience You are comfortable in a fast-paced environment Working at Medusa We are a small team of 16 people, and we move fast. In your role, you will explore a new, exciting product area of Medusa and work closely with our founding team to shape it. This means you need to be comfortable under uncertainty and be ready to take up a lot of responsibility from day one. What you get Opportunity to build a generational company Highly passionate and gifted co-workers Incredibly complex problems to solve Competitive salary based on experience and qualifications Generous options package – in the best 10% among peers Autonomous work Health coverage in the US What we value Hard work We are tackling the problems that no one else in our space has dared to. At Medusa, you  will work hard to solve some of the most complex challenges in engineering. Great work We build exceptional tools so other companies can build exceptional products. Everyone in our organization is passionate about our mission and eager to deliver their best work. Collaborative work We help our colleagues
